An scope class reference can only appear as a function local variable. The following program is spelling out the long names to distinguish between two separate employee structs that are defined in two separate modules: company and college. This also has the added advantage of dealing with null pointers passed by bad code. I prefer the former term, as it makes intuitively clear that the object you are handling has reference semantics. The type parameter can then be used in the regular parameter list of the function. This is a necessary evil to catch sloppy programming.

People get set in their ways, and are blind to the faults in their language of choice. programming with ranges - A detailed blog post about how to do component programming in a idiomatic D way with ranges, with a full working example.
